Edurance in Plain Words

What we learned about the business, and what to do next · October 2026

Edurance is a learning app for school children: it gives each child a short test to find the topics they are weak in, then gives them practice and explanations to fix those weak spots, and shows parents and teachers the progress. We tested the idea in a few ways, and the honest answer is that it is a good idea with a real, working product, but nobody has proved yet that schools will use it properly, that children will keep using it, or that parents will pay for it. When we imagined twenty typical Hyderabad parents and showed them the idea, only about three in ten said they would pay ₹299 a month, and the main reasons for saying no were not the price: parents did not trust an unknown app with their child's data, many already pay a tuition teacher, and they worry about screen time. When we improved the offer so that the class teacher sets the practice as homework and checks it, the school signs a written promise about the child's data, the child takes the test again at the end of term to show what improved, and the next term is free if nothing improved, the number of parents who said yes went up to about four or five in ten. Because these were imagined parents, real parents will probably say yes less often, so we planned on only one parent in ten actually paying. With that, each paying child brings in about ₹148 a month after the school keeps its 30% share and after paying for the AI and other costs, and Edurance needs about 108 paying children every month to cover its running costs of around ₹16,000 a month. In the first year this means a small loss of about ₹58,000, and the team would need about ₹1.5 lakh in total to get through the year without

paying the founders, which fits inside the budget of under ₹2 lakh, but only just: if only one parent in twenty pays, the money would run out. The most promising change is to ask schools to pay instead of parents, for example ₹1,200 per student for the whole year, because then every child in the class counts, the school does not take a share, and the first year could make a profit of about ₹3 lakh, but only if schools agree, which nobody has checked yet. So the plan for the next few weeks is simple: decide which founder is responsible for what, choose one class, one subject and one area of the city, meet at least ten school principals, offer each school a free test and report for one class, and in every meeting ask whether the school would pay ₹1,200 per student per year or would prefer parents to pay ₹299 a month. If at least three schools agree to try it, start with the first class in early November, check how many children actually use it each week, see how many parents really pay, and then use those real numbers, not guesses, to decide whether to continue, change the price, or switch to schools paying.

The imagined parents were AI-simulated, and many of the costs are estimates. Real schools, real parents and real bills will confirm or change these numbers. This is not financial or legal advice.
